

Dear SmartUQ Hiring Team,

I am excited to apply for the Application Engineer position at SmartUQ. With a Ph.D. in Computational & Experimental Mechanics and extensive hands-on experience building physics-based surrogate models and uncertainty quantification workflows at Los Alamos National Laboratory, I am eager to help customers successfully adopt and get value from SmartUQ's platform.

At LANL, I designed and deployed the LAROMance surrogate modeling framework for nuclear reactor materials. This involved building large-scale simulation pipelines, curating complex datasets from thousands of high-fidelity runs, and developing reduced-order surrogate models that deliver fast, accurate engineering predictions. I have deep experience in response surface modeling, optimization, uncertainty quantification, and building user-friendly Python tools — all core capabilities that align closely with SmartUQ's mission.

I am particularly drawn to SmartUQ's focus on making advanced analytics accessible to engineers. I enjoy working directly with customers — understanding their workflows, demonstrating practical solutions, creating training materials, and helping them integrate predictive modeling and uncertainty quantification into their processes. I am confident my combination of technical depth and ability to translate complex methods into actionable insights would allow me to quickly add value to your team and clients.

I would welcome the opportunity to discuss how my background can support SmartUQ's growth.

Sincerely,

Andre Ruybalid
